1. Copy the design_review.tcl script to a folder.
2. Open the target project in Vivado.
3. Run the tcl script..

4. In the Vivado Tcl console, type: `report_design_review -file <file name> -run <run name>`

5. The `report_design_review` command has 3 different options:

- `-file <filename>`: sets the file name & path of the output file. The design review results will be written to this file. If no file name is provided, the design review results will only be written to the Tcl console.
- `-force`: allows an existing output file to be overwritten.
- `-run <run name>`: sets the name of the design run to be analysed – mandatory option. Can be either a synthesis run or an implementation run, but an implementation run should be used for sign-off.

Any other option provided will be ignored.
